Action Taken: -

Shri Shivaji Science & Arts College, Chikhli, Dist-Buldhana. The Department of Computer Science, has been conducted a National State Level Workshop on **"PYTHON"**, on **30ᵗʰ Nov 2022** at **1:00 PM to Onwards.**

Introduction:

Python can be used to develop both desktop and web apps and complex scientific and numerical applications. Python's data analysis features help you create custom big data solutions without so much time and effort. You can also use the Python data visualization libraries and APIs to present data in a more appealing way.

Python is a high-level, interpreted, interactive, and object-oriented scripting language. Python was designed to be highly readable which uses English keywords frequently whereas other languages use punctuation and it has fewer syntactical constructions than other languages.

It is used in :

1. Software Development
2. Web Development
3. System Scripting
4. Mathematics

Features of Python:

Python is Interpreted: It means that each line is processed one by one at runtime by the interpreter and you do not need to compile your program before executing it.

Python is Object-Oriented: Python supports the Object-Oriented style or technique of programming that encapsulates code within objects.

Python is Beginner's Language: Python is an excellent language for beginning programmers and facilitates the construction of a wide range of programs ranging from simple text processing to web browsers to games. Python does not have pointers, which is one of the main challenges that many of us have encountered when programming.

Easy-to-maintain: Python's success is that its source code is fairly easy-to-maintain. One reason for that is, it is read and written like a lot of everyday English.

A Broad Standard Library: One of Python's greatest strengths is the bulk of the library, which makes it very portable and cross-platform compatible. Python has libraries for almost everything one can think of.

Interactive Mode: Support for an interactive mode in which you can enter results from a terminal right to the language, allowing interactive testing and debugging of snippets of code.

Portable: Python can run on a wide variety of hardware platforms and has the same interface on all platforms. You can run the same python program on Windows, Linux, Mac, Raspberry Pi, Mango Pi, Android, etc.

Extendable: You can add low-level modules to the Python interpreter. These modules enable programmers to add to or customize their tools to be more efficient. Generally, we do that using the PIP command.

Databases: Python provides interfaces to all major commercial databases. It has packages to communicate with SQL, NoSQL, etc. databases, ranging from MongoDB to MySQL.

GUI Programming: Python supports GUI applications that can be created and ported to many system calls, libraries, and windows systems, such as Windows, Macintosh, and the X Window system of Unix. It has libraries like Tkinter, WxPython, etc.

Scalable: Python provides a better structure and support for large programs than shell scripting.

Apart from the above-mentioned features, Python has a big list of good features, few of them are-

- Support for functional and structured programming methods as well as OOP.
- It can be used as a scripting language or can be compiled to byte-code for building large applications.
- Very high-level dynamic data types and supports dynamic type checking.
- Supports automatic garbage collection.
- It can be easily integrated with C, C++, COM, ActiveX, CORBA, and Java.

To aware the students about python and its importance we have organized state level workshop on poython.

The participant's response is as follows:
